

CIVICLOOP

An open-source library of human-approved agentic loops for nonprofit operations

LaunchLoop

The first loop in CivicLoop — a human-approved event campaign launch agent for small nonprofits

Why this loop comes first: event campaign launch is narrow, visible, and valuable — small enough to build and evaluate safely, but real enough to prove the observe → draft → validate → approve pattern that later loops (membership, renewals, sponsor reporting) will reuse.

Drafts, validates, and recommends — a human always approves

THE PROBLEM

Campaign prep breaks in four predictable places

1

Details arrive late

Speaker, venue, and date confirmations trickle in after prep should have started.

2

Copy is recreated by hand

Email and social copy get rewritten from scratch for every event, with no consistent quality bar.

3

Audience targeting is unclear

The wrong geography-based segment can be picked when member targeting isn't obvious.

4

Sponsor discounts affect trust

A misapplied sponsor discount touches nonprofit revenue — and sponsor relationships.

Result: campaigns start late, quality varies, and revenue-affecting mistakes slip through.

One user, one trigger, one measurable outcome

USER

Event operations lead or volunteer

Coordinates recurring nonprofit events with marketing and operations teammates.

TRIGGER

A draft or updated Eventbrite event

Webhook-driven when available; simulated by polling for the demo.

SUCCESS = ONE “HUMAN-READY” PACKAGE

Required-field readiness check

Iterable invitation + reminder drafts

Social post draft

Audience segment or clarification request

Sponsor discount validation, rule cited

Placeholders preserved for unknowns

Refreshed drafts after event updates

Dashboard summary with trace + eval status

Six test cases, two fixes, six of six passing

Across all six cases: no real send, publish, price change, or segment creation was ever performed.

A limited pilot — not a broad launch

Approval-only pilot scope

Privacy safeguards on member data

Explicit human operating model

Arize Phoenix trace monitoring

Segment-clarification monitoring

Three feedback loops

Clear rollback criteria

No broad launch until live integrations + controls are proven

LaunchLoop

Human-approved. Evaluated. Ready for a limited pilot.
